# An Airphoto Index To Physical and Cultural Features in the Western United States

As that for the Eastern part was compiled earlier,\* photo interpreters now have the material for the entire Nation.

## INTRODUCTION

THE INDEX PRESENTED is keyed to Agricultural Stabilization and Conservation Service photos and corresponding U. S. Geological Survey Maps. The photo groups

for the 254 selected features in the index were selected from photo index sheets stored at the western laboratory of the Agricultural Stabilization and Conservation Service in Salt Lake City, Utah, and provide representative coverage of physiographic, cultural, vegetative and land use features within the western United States.

\* *Photogrammetric Engineering*, Vol. 31, No. 5, page 896, Sept. 1965.

The index should provide photo interpreters within various fields the opportunity to gather select photo coverage of the western U. S., while at the same time allowing topographic map reference of the selected physical or cultural feature.

The primary concern of the index is to locate characteristic examples of physical and cultural phenomena, and to this end various authoritative texts and uncounted maps were utilized in selecting some of the features; these texts appear in the bibliography, the map references have been omitted because of the great number of aeronautical charts,

film at a nominal scale of 1:20,000 or about 1,667 feet per inch.

#### USING THE INDEX

The index is arranged in alphabetical order by states, from Arizona to Wyoming; features are numbered consecutively from 1 to 254. The county name is listed first, followed by county codes, roll number, exposures, year of photography, number of covering photo index sheets, description of the feature, and the corresponding U. S. Geological Survey topographic map. Photo index numbers are shown in the event that more than one index

---

*ABSTRACT: Cultural geographers, physical geographers, geomorphologists, and photo interpreters should find that this index provides a representative number of examples of physical and cultural features in the western United States. More than 250 of these features have been located on contact prints available from the USDA's photo laboratories at Salt Lake City and Asheville. Descriptions and pertinent data for ordering the photographs has been supplemented with the inclusion of corresponding USGS topographic map coverage for each photo grouping.*

---

large-scale topographic maps, raised relief maps, physiographic diagrams, road maps, and other maps that were involved.

Assistance was freely dispensed by the Geography-Geology Department faculty of Wisconsin State University-Whitewater concerning other features throughout the United States. All features that could be cross referenced to textual accounts have been referenced to the bibliography by code number and page in the text.

It should be noted that since the compilation of the photo index all negative material for Minnesota and South Dakota has been transferred to the Eastern Photo Laboratory, Agricultural Stabilization and Conservation Service, United States Department of Agriculture, 45 South French Broad Ave., Asheville, North Carolina 28801. Contact prints were generally selected as a series of three consecutive photos in the same flight line, e.g. CEU-3DD 1(2)3, however, several of the features necessitated use of more than three consecutive photos, and it was occasionally necessary to list three or more prints from an adjacent flight line to assure complete stereoscopic coverage of large or non-centered features. Parentheses were placed around the print number or numbers designated as the best photos for each feature. All prints listed were taken on panchromatic

sheet was required for coverage of the feature. The notation, "All 1," indicated that a single photo index sheet covers the entire county. Photographic examples of some of the features listed are presented in Figures 2 through 6, with Figure 1 showing the actual geographic location of the features listed in the photo index.

#### ORDERING PHOTOGRAPHS FROM THE INDEX

Prints should be ordered by county name, symbol, film roll number, exposure number, and date as listed in the index. Either single- or double-weight paper should be specified. Orders should be directed to:

Western Laboratory  
Aerial Photography Division  
Agricultural Stabilization and Conservation Service  
U. S. Department of Agriculture  
2505 Parleys Way  
Salt Lake City, Utah 84109.

Photographic coverage taken with nitrate film during the years 1936 through 1941 may be obtained through the National Archives:

National Archives and Records Service  
Cartographic Branch  
General Services Administration  
Washington, D. C. 20408.

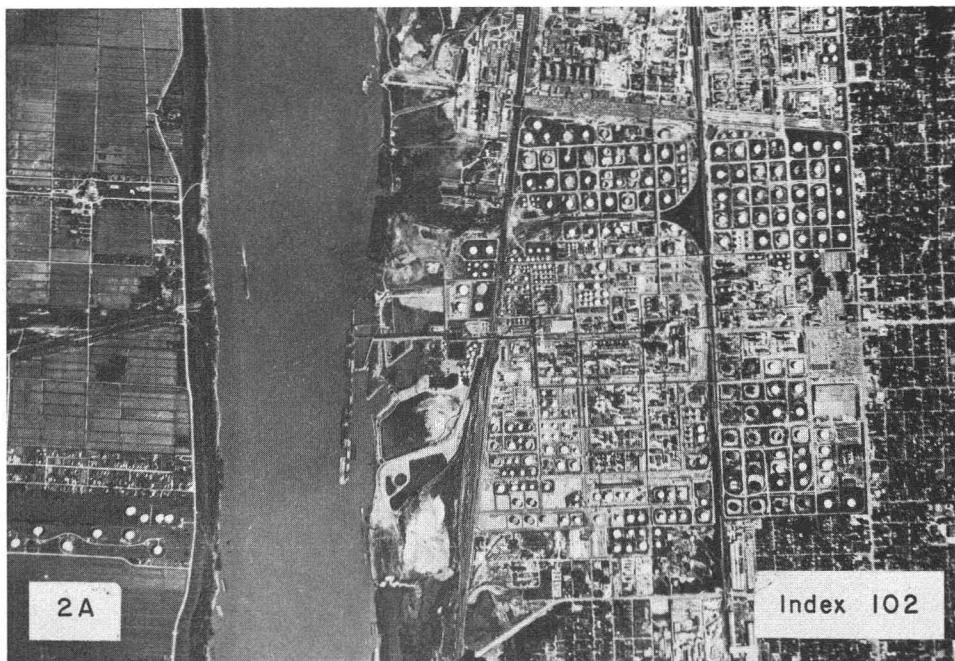

FIG. 2a. Heavy industrial complex along the Mississippi River at Baton Rouge, Louisiana. Oil refineries, tank farms, petrochemical plant, and cement plant are all in evidence, whereas immediately adjacent is a residential area of the city.

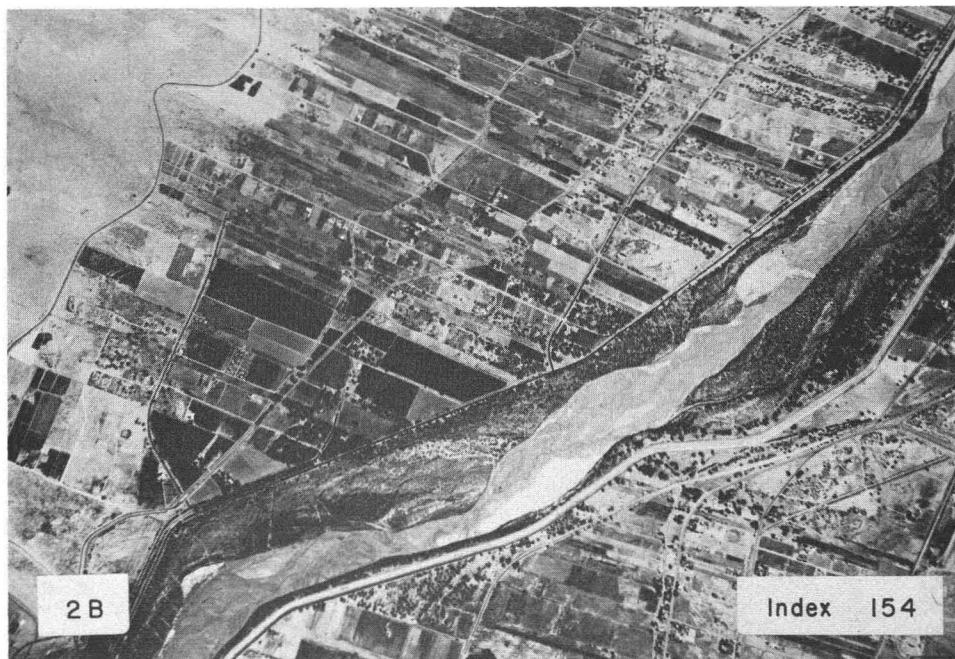

FIG. 2b. Irrigated agriculture on the Upper Rio Grande showing historical connection of early colonization with present day land use patterns.

FIG. 3a. Llano Estacado of West Texas, an area of shallow, randomly distributed depressions where wheat farming depends primarily on pump irrigation because of the low average rainfall.

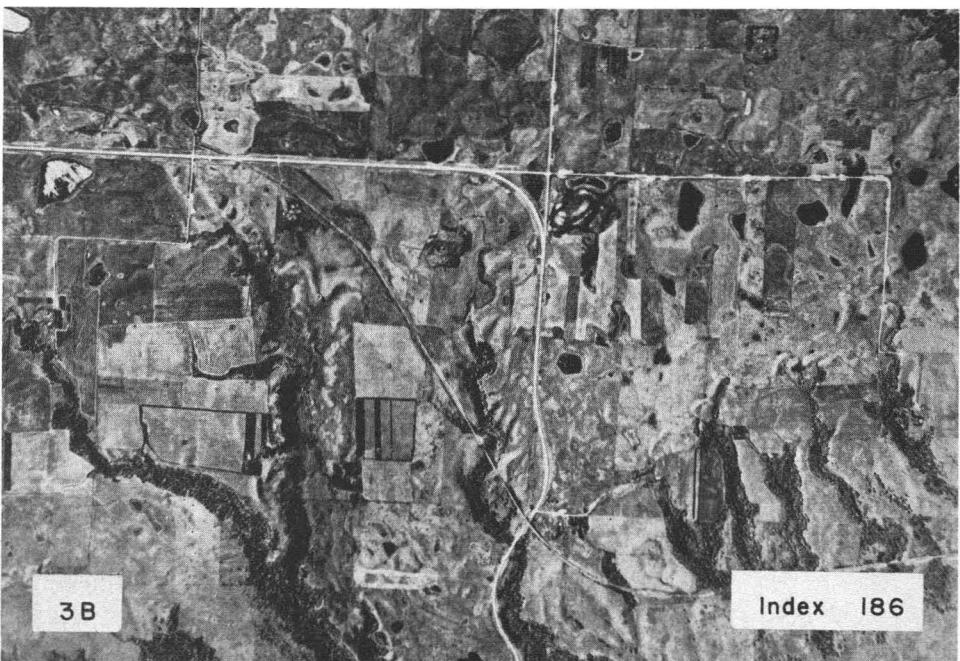

FIG. 3b. Portion of the Bemis moraine with knob and kettle topography; moraine associated with the Mankato stage of Wisconsin glaciation. Livestock and small grains furnish major source of area income.

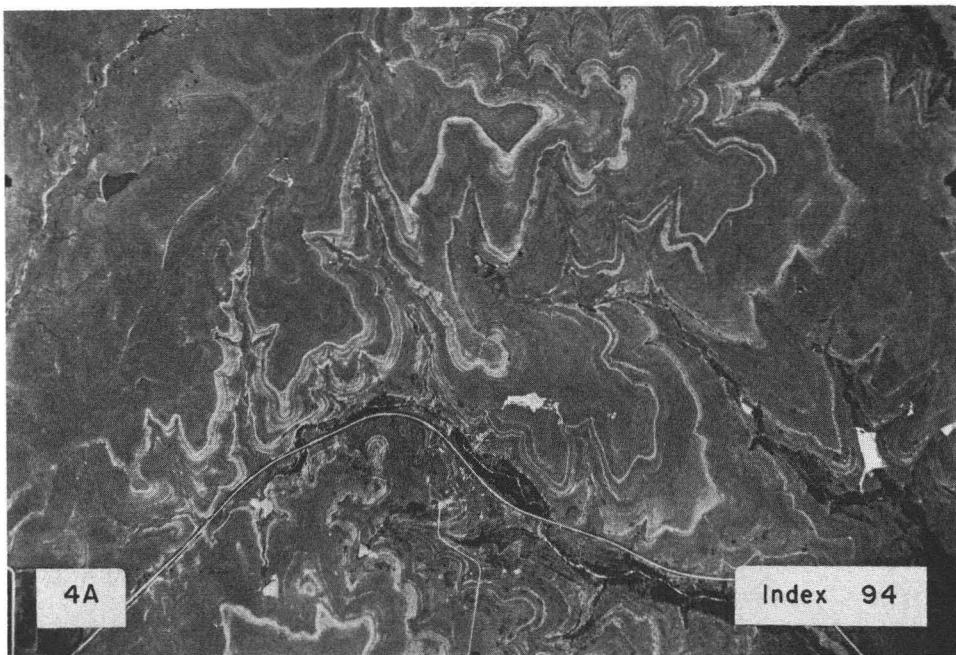

FIG. 4a. Flint Hills of Kansas with an almost contour-map appearance due to the outcropping of limestone ledges. Many small ponds on the creeks of the area conserve water for stock raising which is the main occupation of the rather rocky, thin-soil area.

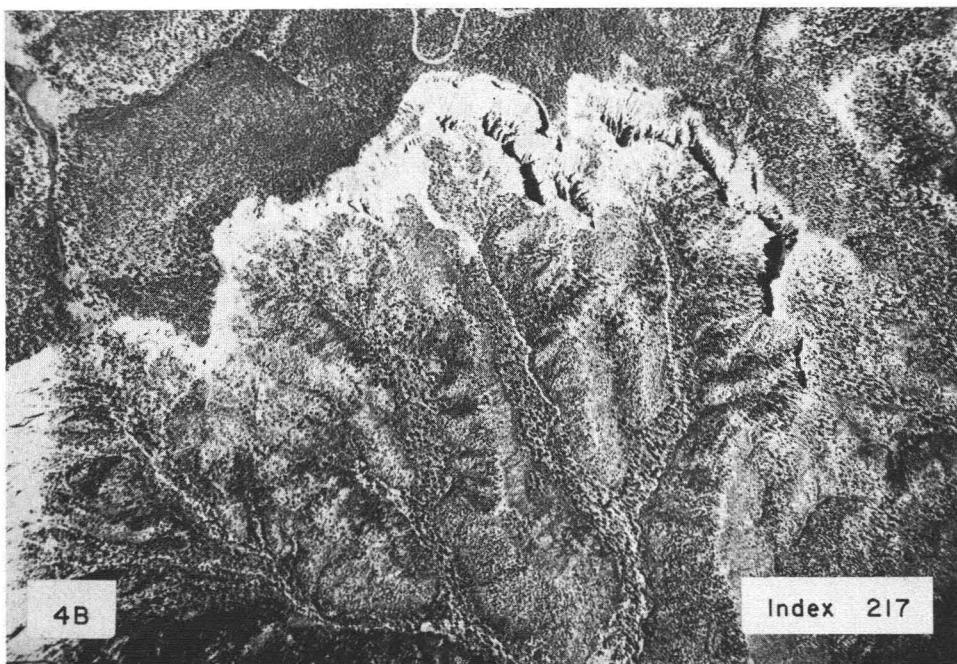

FIG. 4b. Pink Cliffs of Utah, at the southeast edge of the Paunsaugunt Plateau, formed due to resistant Wasatch formation. Bryce Canyon area is a fault-line scarp set aside as a National Park with pine forest providing the major cover in the area.

FIG. 5a. Avery Island, a low salt dome supporting both agriculture and oil exploration, located on the eastern margin of the Mississippi River delta. (To facilitate publication, identifying numbers "5A" and "Index 106" were cropped from the original illustration.—*Editor*)

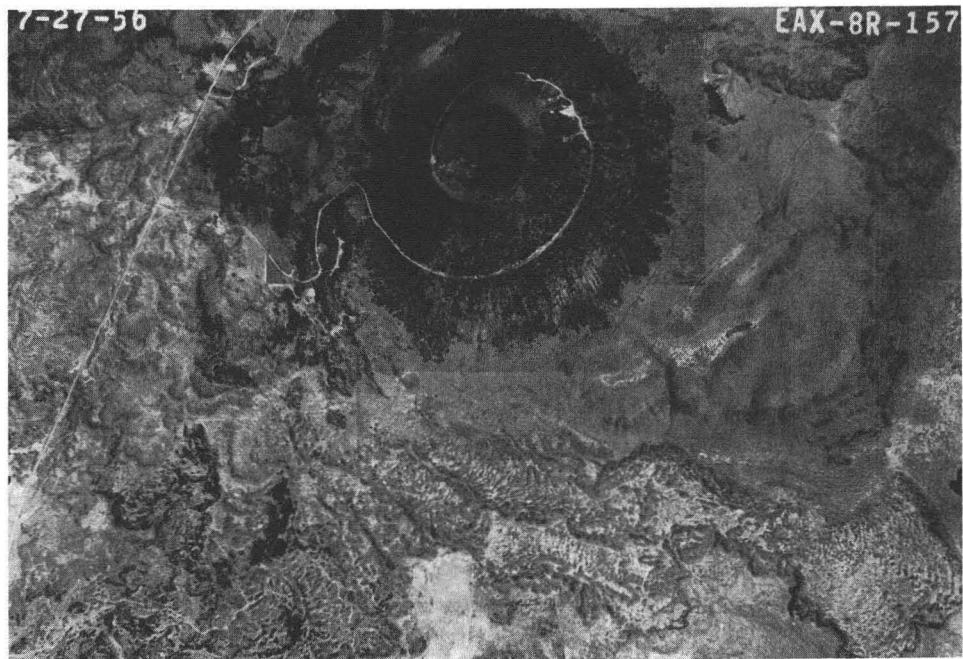

FIG. 5b. Capulin Mountain is an extinct composite volcano rising almost 1000 feet above the surrounding lava plain, with the caldera plunging down over 400 feet from the crater rim. (To facilitate publication, identifying numbers "5B" and "Index 157" were cropped from the original illustration.—*Editor*)

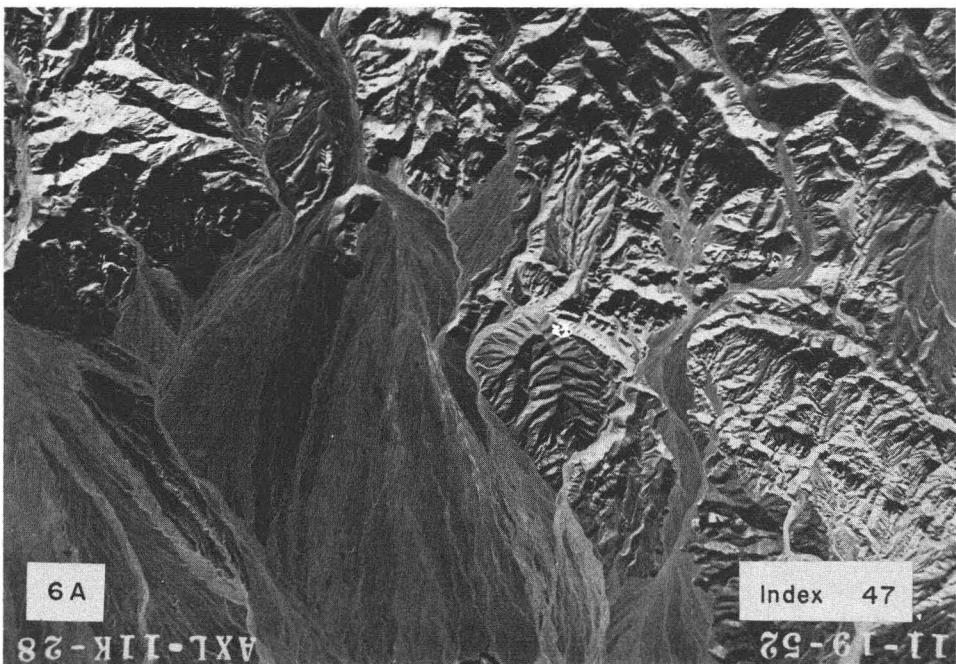

FIG. 6a. Piedmont alluvial fan emitting from the Panimint Range. Semi-arid area of temporary streams which funnel debris into cone-shaped fans along the mountain front.

FIG. 6b. Portion of the Dakota hogback with stream dissection by Deer Creek. Part of the steeply dipping Cretaceous Dakota sandstone outcropping at the western edge of the Colorado Piedmont. (To facilitate publication, identifying numbers "6B" and "Index 63" were cropped from the original illustration.—Editor)

Payment must be made in advance on all orders, and 4 to 6 weeks may be required for delivery of prints. As of June 1967 prices for contact prints at the nominal scale of 1:20,000 were:

Number of prints	Price per print
1-5	\$1.00
6-100	0.85
over 100	0.65

Enlargements may be obtained at four scales ranging from 1:15,840 on prints 14 by 14 inches to 1:4,800 on prints 40 by 40 inches. Prices vary from \$2.00 to \$5.60 per print. Photo index sheets at a scale of 1 inch per mile cost \$2.00 for a sheet 20 by 24 inches.

#### ORDERING U. S. GEOLOGIC SURVEY MAPS FROM THE INDEX

Topographic map quadrangles should be ordered by name, date and scale as shown in the index. The  $7\frac{1}{2}$  and 15 minute quadrangles are printed at scales of 1:24,000 and 1:62,500 respectively. Where this standard coverage is not available, 1:250,000 and 1:125,000 quadrangles have been listed.

Maps of areas west of the Mississippi River, including all of Louisiana and Minnesota, should be ordered from:

U. S. Geologic Survey  
Distribution Section  
Federal Center, Building 25  
Denver, Colorado.

#### ACKNOWLEDGMENTS

The author wishes to express his thanks to the State Research Committee of the Wisconsin State University system and to the Dean of the Graduate School, Professor Donald Graham, for the financial and administrative

assistance rendered in obtaining the research grant that made this photo index a reality. Dr. T. Eugene Avery, Chairman and Professor, Department of Forestry, University of Illinois, who acted as co-author of a similar index for the eastern U. S., merits special mention because of his constant academic hand in seeing the western index to completion.
